

## UTSeeker2

info file – suppress=EnglishLevel

Player-only tool for browsing UT servers (addressing monsters in big parts)

1) First Information. A previous version of UTSeeker has been released in purpose to expand default browsing from GameSpy only, adding 333Networks (still in work I guess). Yes, you don't have to believe me, Master Server original by Epic is non-functional for years – CHECK THIS WELL LOOKING AT PLAYER LOG. So if you want this newer one is better to get rid of Seeker files previously added to not be bugged by double TABS related to different game-types served. Before to proceed you can read next lines and take your decision.

2) 333Networks probably being still in development at this moment, I was interested in browsing MH game by example. I noticed MH tab filled by 333Networks with over 700 servers – even UT Demo servers unjoinable by normal UT99 players. Because I felt a bit bugged by a huge number of supposed servers even NON-MH, I removed in this version 333Networks master, doing query only at GameSpy, later I simply found 45 MH servers – the real number based on this game-type.

Erata\_\_ MH = MonsterHunt game-type.

3) My case, I backup-ed previous version of UTSeeker for future usage if I'll need it.

4) Usage ? **UTSeeker2.u** and **UTSeeker2.int** will go to System folder from UT. Done. Removal ? Delete these 2 files from System folder.

5) What is that folder from package ? Source-code of this mod – feel free to play with it as you want.

That's it for today.
